## A Certain Uncertainty

Nobody in business likes uncertainty. That is not reality. The reality is that uncertainty is the only thing that is certain. The "known knowns" break down periodically and bring periods of upheaval that appear to break all the old rules considered concrete even a short time ago.

Technological advancements often have the strongest pull on certain segments of business activity and this causes the perceived rule structure to change. Business investors therefore must adapt to new rules of the present reality.

One would think that technological advancements would always be a positive effect on the energy industry. Advancements in computer processing, seismic research, design and construction technologies, along with a myriad of other humanly-divined efforts, have allowed for less costly and more productive systems to be created and employed than in the past. Continued technological advancements are widely considered to be a certainty. Over the past half century these efforts continually made it cheaper and more efficient to find, extract and move fossil fuels, whether oil, gas or coal, to its final market. In business this is generally considered good. One can more easily predict one's efforts taking into consideration the certainty that the growing world economy and its demand for energy will continue to require more and more oil and gas to satisfy its never-ending development. Occurring in a world of limited and perceived finite resources, one would expect that the value for the product would be maintained at an ever increasing profitable level. Transportation is still the major and fastest growing consumer of fossil energy, currently using well over 50% of oil produced world-wide. The US is the largest consumer, but emerging economies, mainly China and India with their rapid growth, have driven much of this peaking demand in the past 30 years. However, there is another side to this technology coin and when it brings a certainty, there will be yet another side causing certain uncertainties to develop.

Since the advent of the computer each technological breakthrough seems to occur more frequently and have a greater consequence than the last. The life blood of industry and transportation revolves around fossil fuels and the marine market is no exception. It's likely that fossil fuels will continue to drive this sector and the growth in demand will continue. Technological advancements cannot be stopped and breakthroughs related to extraction of resources, such as minerals and fossil fuels, should help the general progression of business and society. However, in the business of doing business, is too much good technology sometimes a bad thing?
